

AccessDriver Tutorial With Pictures (Proxy Functions)

AD (AccessDriver) is a powerful tool to hack website. There are many useful functions in it. Today I will only show you how to leech and test proxies with it. However it is the preparative for hacking. You can download this tool from <http://www.accessdriver.com/php/getad.php>.

How to leech proxies

1. You should have a leech list first. A leech list is a list of URLs that contains the latest proxies.

It looks like this:

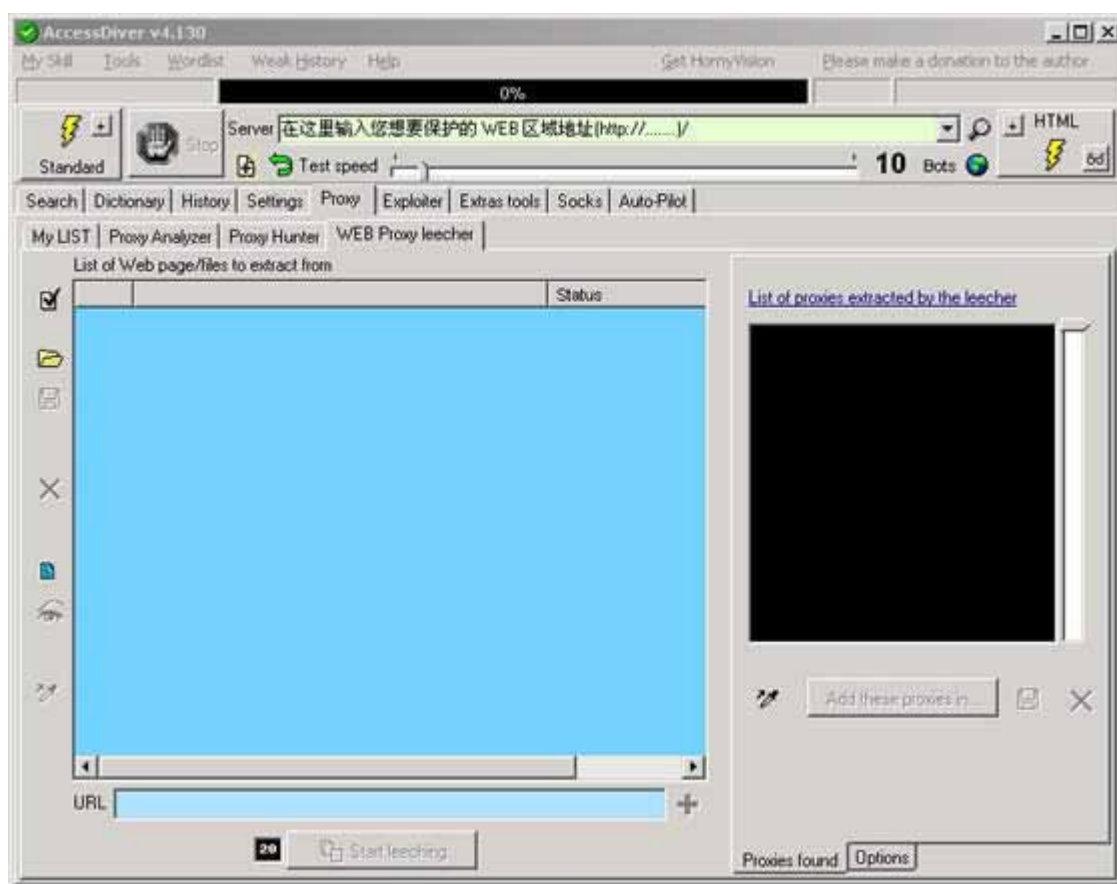

<http://www.proxy4free.com/page7.html>
<http://www.proxy4free.com/page8.html>
<http://www.proxy4free.com/page5.html>
<http://www.proxy4free.com/page6.html>
<http://www.proxymania.com/page2.html>
<http://www.proxymania.com/page3.html>
<http://www.proxy4free.com/page9.html>
<http://www.proxymania.com/page1.html>
<http://www.freepublicproxies.com/page5.html>
<http://www.proxy4free.com/page1.html>
<http://www.freepublicproxies.com/page3.html>
<http://www.freepublicproxies.com/page4.html>
<http://www.proxy4free.com/page3.html>
<http://www.proxy4free.com/page4.html>
<http://www.proxy4free.com/page10.html>
<http://www.proxy4free.com/page2.html>
<http://www.proxymatrix.com/page2.html>
<http://www.proxymatrix.com/page1.html>
<http://www.proxymatrix.com/page3.html>
<http://www.proxymatrix.com/page5.html>
<http://www.proxymatrix.com/page4.html>

It's important to collect the proxy source pages and add them to your leech list. You can save the leech list as a TXT file.

2. Start AD :)

AccessDriver Tutorial With Pictures (Proxy Functions)

3. Switch to "web proxy leecher" page.

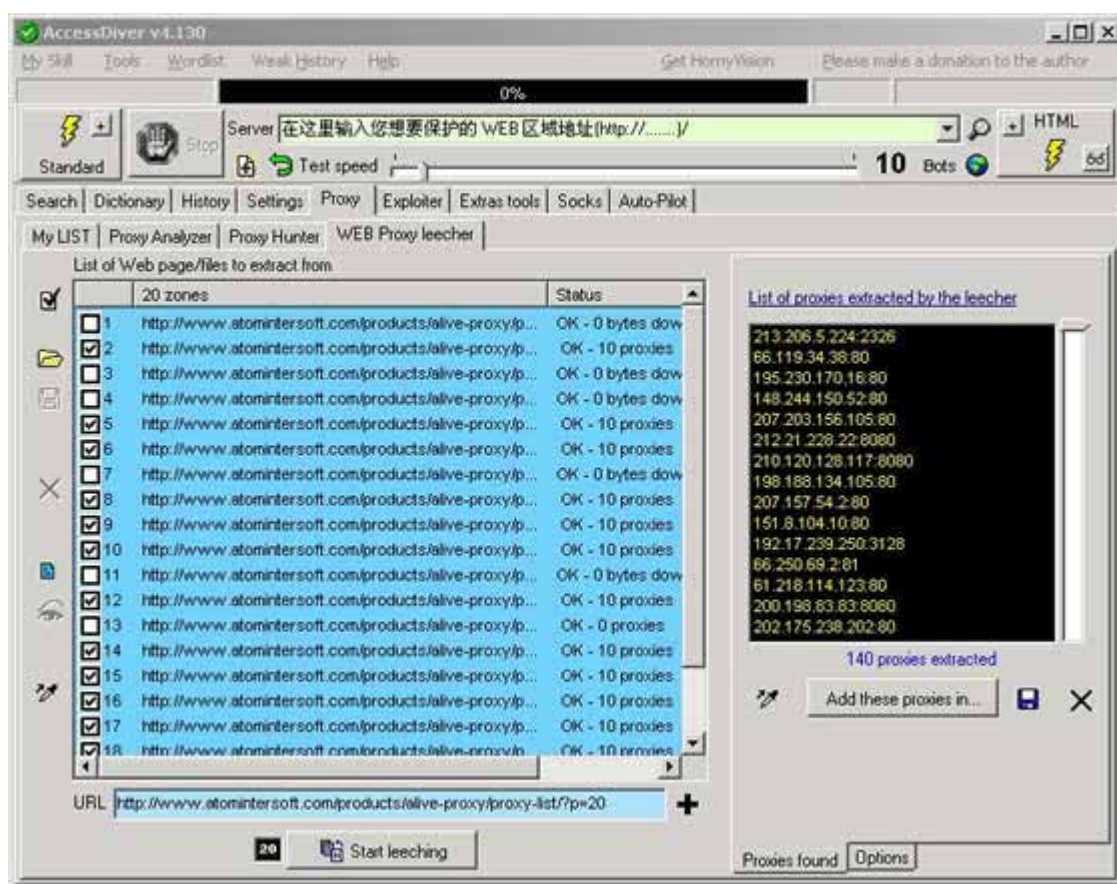

4. Import your leech list by clicking the file folder icon.

5. Click the "Start leeching" button and wait the process bar to become 100%.

6. Now you have got 140 proxies by leeching. In fact you can get thousands of proxies if only your leech list is large enough. You can save these

proxies to your file, or you can continue using AD to test them.

How to test proxies

AD can test and classify proxies with a high speed. But the information it detects is limited and it cannot detect the country info and SSL info of proxies.

If you want more information, you can use other tools such as ProxyChecker or Proxyrama. You can find them at <http://www.my-proxy.com/com/download.php>.

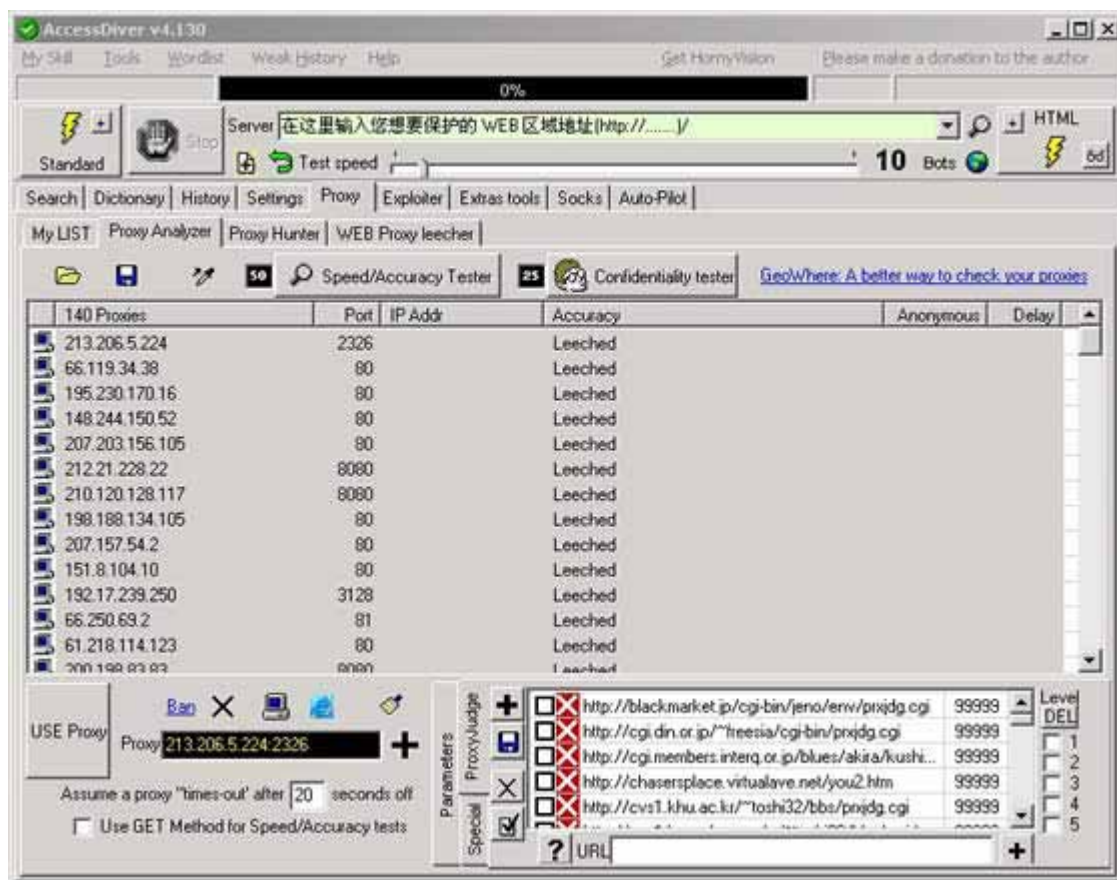

Now we start to test the proxies with AD.

7. Click the button below the proxy frame and choose the "Add these proxies into the proxies ANALYZER" option.

AccessDriver Tutorial With Pictures (Proxy Functions)

8. Now enter the "Proxies Analyzer" page. The proxies you leached are waiting to be tested there.

9. You should have Proxyjudge before testing. Proxyjudge is an important resource to classify proxies. You can find them at <http://www.my-proxy.com/com/proxyjudge.php>.

Proxyjudges always die in a short time because so many people are using them. So it is necessary to detect the validity of the Proxyjudges before testing.

The Proxyjudge list is shown in the "Proxy Judge" page in "Proxy Analyzer" page. Right click the list and choose the "Verify all scripts" option. "Sort the list per speed" -> "sort by speed" after verifying and check 1~2 fastest Proxy Judge. They will be used to test and classify proxies. Remember that too many Proxy Judge will make the testing process very long,

which also add the number of uncheckable proxies.

Some proxyjudges seems invalid now, but you need not to remove them from list because perhaps they will relive later. You should always verify the proxyjudge scripts every time before testing proxies.

10. Now select all the proxies and press the big button "Speed/Accuracy Tester" to analyze the speed of the proxies. You can delete many bad proxies after speed testing to save time in next testing.

11. Press "Confidentiality Tester" after speedtesting to classify the proxies. Right click the result and choose the relevant options to delete unqualified proxies. I always only remain the level1 and level2 proxies. Do not know what proxy level is? Please read other articles in My-Proxy.Com :)

12. Select all the proxies remained and press the save button to save them to a file.
